

Emittance growth induced by electron cloud

Elena Benedetto
RLC meeting, 03/03/06

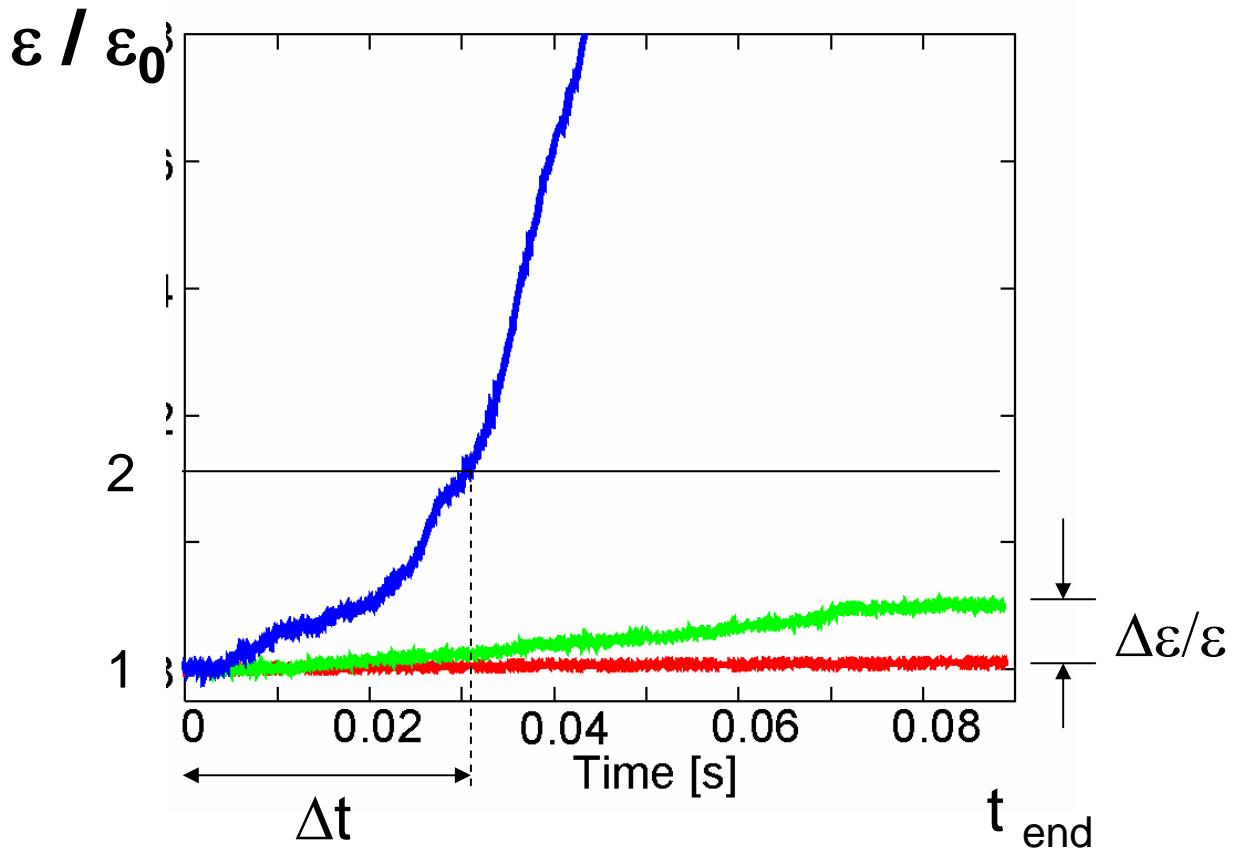

Simulation ingredients

- Simulations with HEADTAIL
- LHC at injection parameters
- Round beam
- $Q' = 2$
- Variable EC density
- Rectangular chamber with electric conducting b.c.

2 different cases

- Field free region
- Dipole regions:
 - e- motion frozen in horiz. plane
 - stripes

How do I compute the emittance growth rate

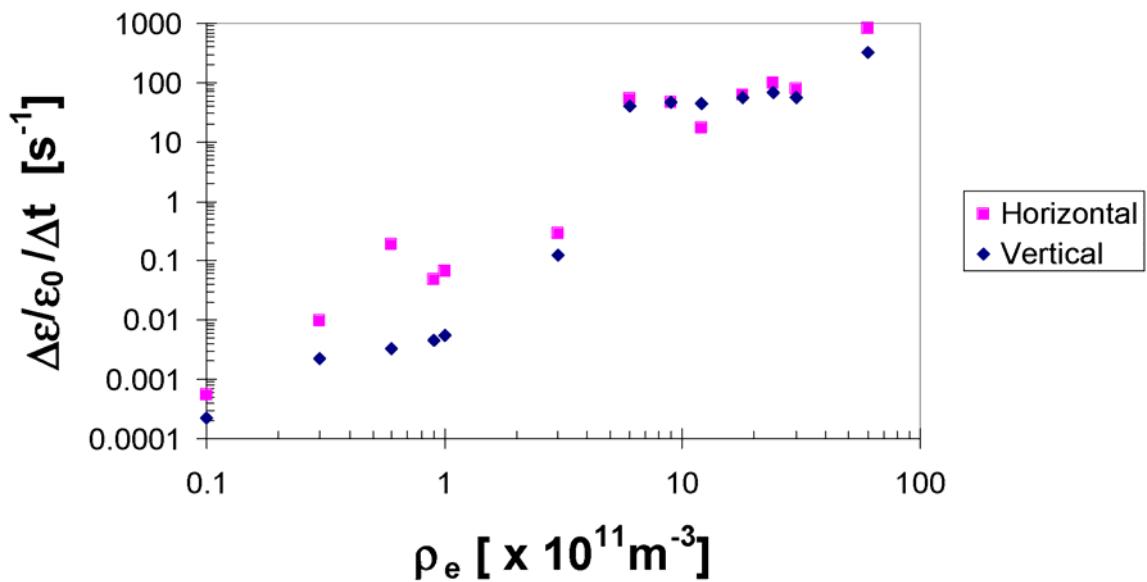

- If the emittance is doubled:

$$(2-1)/\Delta t$$

- If the growth is smaller:

$$(\Delta \varepsilon / \varepsilon) / t_{\text{end}}$$

LHC w/o magnetic field

LHC with stripes
