

LANDAU DAMPING BY OCTUPOLES AND SPACE CHARGE

E. Metral

- ◆ **Self-consistent space-charge tune shift for the quasi-parabolic distribution : Status ?**
- ◆ **Approximation**

**Error in the plot presented at
the LCE meeting 03/10/03 !**

“Correct” plot

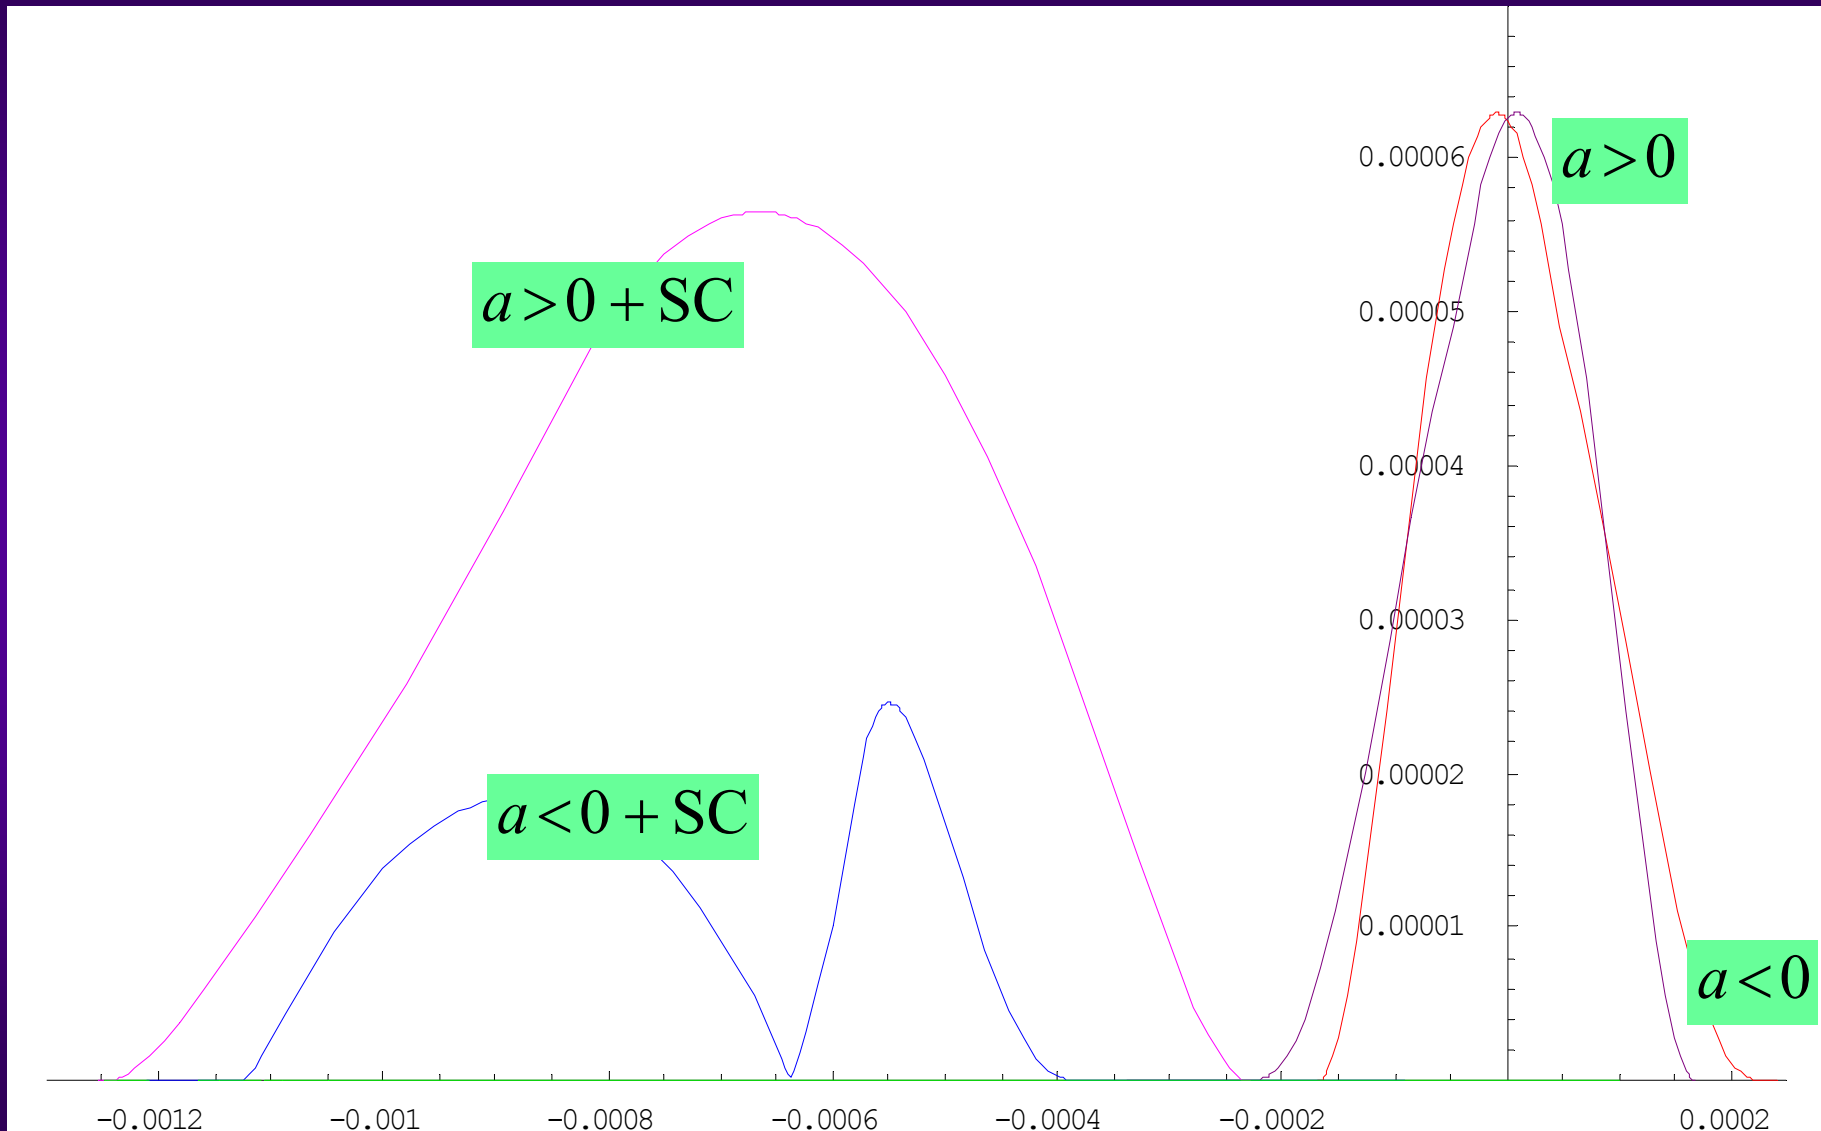

- ◆ The 10 double integrals to draw the stability diagram have not yet been solved

Approximation of the plot by terms in J_x and J_y only

Stability diagram for the approximated tune shift (Nominal LHC beam at injection)

CONCLUSION

- ◆ The quasi-parabolic distribution is thought to be a good approximation for the transverse distributions
- ◆ Where does the gap come from in both plots ?
⇒ From the longitudinal motion, which has been neglected until now and which will put particles here, and thus will increase the stability diagram
